## OSL640: INTRODUCTION TO OPEN SOURCE SYSTEMS

WEEK II LESSON I

THE SED UTILITY

PHOTOS AND ICONS USED IN THIS SLIDE SHOW ARE LICENSED UNDER CC BY-SA

# LESSON I TOPICS

### The sed Utility

- Definition / Purpose
- Usage
- Using sed as a Filter with Pipeline Commands
- Demonstration

### Perform Week II Tutorial

- Investigation I
- Review Questions (Parts A and B)

## **Purpose**

The **sed** command stands for **Streaming Editor**.

The sed command is used to **manipulate text** that is contained in a **text file** or via a **pipeline command**.

Although the sed command does NOT change content <u>inside</u> a text file, this command acts like a "on-the-fly" text editor to display modified text on the **screen**, **redirect** to a file or act as a **filter** within a pipeline command.

### Usage:

sed [-n] 'address instruction' filename

### How it Works:

- The sed command reads **all lines in the input file** and will be exposed to the expression (i.e. area contained within **quotes**) one line at a time.
- The expression can be within single quotes or double quotes.
- The expression contains an address (match condition) and an instruction (operation).
- If the line matches the address, then it will perform the instruction.
- Lines will display be default unless the -n option is used to suppress default display

### Usage:

```
sed [-n] 'address instruction' filename
```

### **Addresses:**

- Can use a line number, to select a specific line (for example: 5)
- Can specify a range of line numbers (for example: 5, 7)
- Regular expressions are contained within forward slashes
   (e.g. /regular-expression/)
- Can specify a regular expression to select all lines that match a pattern (e.g /^[0-9].\*[0-9]\$/)
- If NO address is present, the instruction will apply to ALL lines

### Usage:

sed [-n] 'address instruction' filename

### **Common Instructions:**

- p Print lines that match the address (commonly used with -n option)
- **d** Omit (**delete**) display of lines that match the address
- q Print lines including line that matches address and then quit processing
- **s** Substitute text to replace a matched regular expression (similar search and replace)

### Example I

The following sed command line displays all lines in the readme file that contain the word **line** (all lowercase).

In addition, because there is no -n option, sed displays all the lines of input.

As a result, sed displays the lines that contain the word line twice.

```
sed '/line/ p' readme
Line one.
The second line.
The second line.
The third.
This is line four.
This is line four.
This is line four.
Five.
This is the sixth sentence.
This is line 7.
This is line 7.
Eight and last.
```

Unless you instruct it not to, sed sends **all lines**, selected or not to standard output.

When you use the -n option on the command line, sed sends only those lines to stdout that you specify with the print p command

### Example 2

The following sed command displays contents of a file from a **range** of line numbers.

sed -n '3,6 p' readme
The third.
This is line four.
Five.
This is the sixth sentence.

The print p instruction using the -n option only displays lines 3 through 6.

### Example 3

The following sed command displays the first five lines of text just as a head -5 lines command would.

#### sed '5 q' readme

Line one. The second line. The third. This is line four.

Five.

### Example 4

The following sed command displays a **TAB** character for lines contained in a file.

```
$ sed 's/^./\t&/' readme
Line one.
The second line.
The third.
etc...
```

The replacement string (between the second and third forward slashes) contains a backslash escape sequence that represents a **TAB** character (\t) followed by an ampersand (\(\&\)).

The **ampersand** character (§) takes on the value of what the regular expression matched.

### Example 5

The following sed command uses a **regular expression** and the **quit** instruction.

```
sed '/[0-9][0-9][0-9]$/ q' myfile
sfun 11
cool 12
Super 12a
Happy112
```

The regular expression in the following expression [0-9][0-9] matches **three digits** at the <u>end</u> of a line.

The command will process the file, one-line at a time, beginning at the top and (by default) outputting each line to standard output.

Once the regular expression is matched, it will display the matched line and stop processing the sed command.

### Using sed Utility as a Filter with Pipeline Commands

Although sed can be used as a streaming editor for text contained within a text file, the sed command can also be used as a **filter** within a **pipeline command**.

### **Examples**

```
ls | sed 's/^[0-9]/x/g'
echo "I like Linux" | sed 's/ /,/g'
```

### **Instructor Demonstration**

Your professor will demonstrate additional examples using the **sed** utility.

Pathname of cars database: ~osl640/cars.txt

#### Commands

```
sed -n '3,6 p' cars.txt
sed '5 d' cars.txt
sed '5,8 d' cars.txt
sed '5 q' cars.txt
sed -n '/chevy/ p' cars.txt
sed '/chevy/ d' cars.txt
sed '/chevy/ q' cars.txt
sed '/chevy/ q' cars.txt
sed 's/[0-9]/*/' cars.txt
sed 's/[0-9]/*/g' cars.txt
sed '5,8 s/[0-9]/*/' cars.txt
sed '5,8 s/[0-9]/*/* cars.txt
```

### Contents of cars database file:

plym fury 77 73 2500 chevy nova 79 60 3000 ford mustang 65 45 17000 volvo gl 78 102 9850 ford 1td 83 15 10500 Chevy nova 80 50 3500 fiat 600 65 115 450 honda accord 81 30 6000 ford thundbd 84 10 17000 toyota tercel 82 180 750 chevy impala 65 85 1550 ford bronco 83 25 9525

## **Getting Practice**

To get practice to help perform online assignment #3, perform Week I I Tutorial:

- INVESTIGATION I: USING THE SED UTILITY
- LINUX PRACTICE QUESTIONS (Parts A and B)

## OSL640: INTRODUCTION TO OPEN SOURCE SYSTEMS

WEEK 11: LESSON 2

THE AWK UTILITY

PHOTOS AND ICONS USED IN THIS SLIDE SHOW ARE LICENSED UNDER CC BY-SA

# LESSON 2 TOPICS

## The awk Utility

- Definition / Purpose
- Usage
- Using awk as a Filter with Pipeline Commands
- Demonstration

### **Perform Week II Tutorial**

- Investigation 2
- Review Questions (Parts C and D)

### **Definition / Purpose**

**Awk** is mostly used for **pattern scanning** and **processing**. It searches one or more files to see if they contain lines that **matches** with the specified patterns and then performs the associated **actions**.

Reference: <a href="https://www.geeksforgeeks.org/awk-command-unixlinux-examples/">https://www.geeksforgeeks.org/awk-command-unixlinux-examples/</a>

The awk command is useful for reading database files to produce reports.

### Usage

```
awk [-F] 'selection criteria {action}' file-name
```

#### How it Works:

- The **awk** command reads all lines in the input file and will be exposed to the **expression** (contained within **quotes**) for processing.
- The expression (contained in quotes) represents **selection criteria**, and action to **execute** contained within braces {}
- if selection criteria is **matched**, then **action** (between braces) is **executed**.
- The -F option can be used to specify the default field delimiter (separator) character eg. awk -F''; " (would indicate a semi-colon delimited input file)

### **Usage**

```
awk [-F] 'selection _criteria {action}' file-name
```

#### **Selection Criteria:**

• You can use a regular expression, enclosed within slashes, as a pattern.

```
For example: /pattern/
```

 The ~ operator tests whether a field or variable matches a regular expression.

```
For example: $1 \sim /^{0-9}
```

• The !~ operator tests for no match.

```
For example: $2 !~ /line/
```

### **Usage**

```
awk [-F] 'selection _criteria {action}' file-name
```

#### **Selection Criteria:**

- You can perform both numeric and string comparisons using relational operators ( > ,>= , < ,<= ,== , != ).</li>
- You can combine any of the patterns using the Boolean operators
   | (OR) and && (AND).
- You can use **built-in variables** (like **NR** or "record number" representing line number) with comparison operators.

```
For example: NR >=1 && NR <= 5
```

### **Usage**

```
awk [-F] 'selection _criteria {action}' file-name
```

#### **Action (execution):**

- Action to be executed is contained within braces {}
- The print command can be used to display text (fields).
- You can use parameters like \$1, \$2 to represent first field, second field, etc. The parameter \$0 represents all fields within a record (line).
- You can use built-in variables (like NR or "record number" representing line number

```
eg. {print NR, $0} (will print record number, then entire record)
```

# **Example I**

cat data.txt

Saul Murray professor

David Ward retired

Fernades Mark professor

awk '{print}' data.txt

Saul Murray professor

David Ward retired

Fernades Mark professor

If no pattern is specified, awk selects **all** lines in the input

# Example 2

cat data.txt

Saul Murray professor

David Ward retired

Fernades Mark professor

awk '/^[F-Z]/ {print}' data.txt

Saul Murray professor

Fernades Mark professor

You can use a regular expression, enclosed within slashes, as a pattern.

In this case, the pattern is matched at the BEGINNING of each line (record) read from the input file.

# Example 3

cat data.txt

Saul Murray professor

David Ward retired

Fernades Mark professor

awk '/^[F-Z]/' data.txt

Saul Murray professor

Fernades Mark professor

If no action is specified, awk copies the selected lines to standard output

### Using Variables with awk Utility

You can use parameters which represent fields within records (lines) within the expression of the awk utility.

The parameter \$0 represents all of the fields contained in the record (line).

The parameters \$1, \$2, \$3 ... \$9 represent the first, second and third to the 9<sup>th</sup> fields contained within the record. Parameters greater than nine requires the value of the parameter to be placed within braces (for example: \${10}, \${11}, \${12}, etc.)

Unless you separate items in a print command with a **comma**, awk **catenates** them.

## **Example 4**

cat data.txt

Saul Murray professor

David Ward retired

Fernades Mark professor

awk '\$1 ~ /^[F-Z] / {print}' data.txt

Saul Murray professor

Fernades Mark professor

The parameters \$1, \$2, \$3 ... \$9 represent the first, second and third to the 9<sup>th</sup> fields contained within the record.

awk '\$3 ~ /retired/ {print}' data.txt

David Ward retired

The ~ operator tests whether a field or variable matches a regular expression

# Example 5

cat data.txt

Saul Murray professor

David Ward retired

Fernades Mark professor

awk '\$3 !~ /retired/ {print}' data.txt

Saul Murray professor

Fernades Mark professor

The !~ operator tests for no match.

### Example 6

#### cat customer.dat

A100 Acme-Inc. 5400

R100 Rain-Ltd. 11224

T100 Toy-Inc. 3413

awk '\$3 > 10000 {print}' customer.dat

R100 Rain-Ltd. 11224

awk '\$3 <= 6000 {print}' customer.dat</pre>

A100 Acme-Inc. 5400

T100 Toy-Inc. 3413

Using <u>relational</u> operators with the awk command.

### Example 7

#### cat customer.dat

A100 Acme-Inc. 5400

R100 Rain-Ltd. 11224

T100 Toy-Inc. 3413

awk '\$3 >= 5000 && \$3 <= 10000 {print}' customer.dat

A100 Acme-Inc. 5400

awk '\$3 <= 5000 || \$3 >= 10000 {print}' customer.dat

R100 Rain-Ltd. 11224

T100 Toy-Inc. 3413

Using the && and | | conditional operators with the awk command.

### Example 8

cat customer.dat

A100 Acme-Inc. 5400

R100 Rain-Ltd. 11224

T100 Toy-Inc. 3413

awk '\$3 > 10000 {print \$1,\$2}' customer.dat

R100 Rain-Ltd.

awk '\$2 ~ /Acme-Inc./ {print \$3}' customer.dat

5400

Using parameters to specify fields with print command to display output.

### Other Variables for awk Utility

The table below show other variables that can be used with the awk command.

- FILENAME Name of the current input file
- **FS** Input field separator (default: SPACE or TAB)
- **NF** Number of fields in the current record
- NR Record number of the current record
- **OFS** Output field separator (default: SPACE)
- ORS Output record separator (default: NEWLINE)
- RS Input record separator (default: NEWLINE)

### Example

cat customer.dat

A100 Acme-Inc. 5400

R100 Rain-Ltd. 11224

T100 Toy-Inc. 3413

awk '{print NR,\$0}' customer.dat

1 A100 Acme-Inc. 5400

2 R100 Rain-Ltd. 11224

3 T100 Toy-Inc. 3413

awk 'NR ==2 {print}' customer.dat

R100 Rain-Ltd. 11224

awk 'NR > 1 && NR < 5{print}' customer.dat</pre>

R100 Rain-Ltd. 11224

T100 Toy-Inc. 3413

Using NR (record number)
variable with the awk utility

### Using awk Utility as a Filter

Although awk can be used as a streaming editor for text contained within a text file, awk can also be used as a filter using a pipeline command.

### **Examples**

```
ls | awk '{print $1,$2}'
```

### **Instructor Demonstration**

Your instructor will demonstrate additional examples of using the **awk** utility.

## **Getting Practice**

To get practice to help perform online assignment #3, perform Week II Tutorial:

- INVESTIGATION 2: USING THE AWK UTILITY
- LINUX PRACTICE QUESTIONS (Parts C and D)
